Dear Editors,

Please consider the manuscript “Pushout Attachments and Conditional Complexity of Executable Models” for publication in *Applied Categorical Structures*.

The paper develops a categorical framework for modular extensions of executable models, combining pushout attachments and cofibrations in typed presheaf categories with semantic preservation and conditional description complexity. We believe its connection between categorical structure and executable-model selection is well suited to the journal.

Thank you for your consideration.

Sincerely,

Alexander Kolpakov
